

PRIOR AUTHORIZATION POLICY

POLICY: Inflammatory Conditions – Olumiant (baricitinib tablets – Lilly)

APPROVAL DATE: 06/18/2019; selected revision 04/01/2020

OVERVIEW

Olumiant is an inhibitor of the Janus kinases (JAK) pathways approved for the treatment of adults with moderately to severely active rheumatoid arthritis (RA) who have had an inadequate response to one or more tumor necrosis factor inhibitors.¹ It is a targeted synthetic disease-modifying antirheumatic drugs (DMARD) that may be used either as monotherapy or in combination with MTX or other conventional synthetic DMARDs for RA. Olumiant is not recommended for use in combination with other JAK inhibitors, or in combination with biologics or potent immunosuppressants such as azathioprine or cyclosporine.

Disease Overview

Inflammatory conditions are chronic, systemic, autoimmune, inflammatory disorders of unknown origin characterized by inflammation.² RA causes joint swelling, stiffness, and tenderness which may lead to cartilage damage, bone erosions, and joint destruction, and is often associated with significant activity limitations and disability. Compared with patients who do not have RA, mortality is increased in patients with established RA with approximately 40% of deaths in the RA population attributed to cardiovascular causes such as ischemic heart disease or stroke.³ RA is associated with a decreased quality of life and can contribute to reduced employment rates and increased costs of care.² In RA, Olumiant inhibits JAK, an intracellular enzyme that transmits signals on the cellular membrane to influence cellular processes of hematopoiesis and immune cell function.¹ JAKs phosphorylate and activate Signal Transducers and Activators of Transcription (STAT) which then modulate intracellular activity such as gene expression. Inhibition of JAK enzymes block multiple cytokines resulting in modulation of the immune response involved in RA.

Guidelines

Guidelines from the American College of Rheumatology (ACR) [2015], updated prior to the approval of Olumiant, have TNF inhibitors and non-TNF biologics, administered with or without MTX, equally positioned as a recommended therapy following a trial of a conventional synthetic DMARD (e.g., MTX, leflunomide, hydroxychloroquine, sulfasalazine).⁴ Although Olumiant is not yet addressed, another JAK inhibitor (Xeljanz/Xeljanz XR [tofacitinib tablets, tofacitinib extended release tablets]) is not recommended for early RA; in established RA, Xeljanz/XR is most frequently recommended for patients with moderate or high disease activity despite use of multiple biologics.

Safety

Olumiant has Boxed Warnings regarding increased risk of developing serious infections which may lead to hospitalization or death.¹ Patients who develop a serious infection should interrupt treatment with Olumiant until infection is controlled. Patients should be tested for tuberculosis (TB) prior to starting therapy and monitored during treatment with Olumiant. There is also a Boxed Warning for lymphoma and other lymphoproliferative disorders which have been observed in patients taking Olumiant. Viral reactivation, including cases of herpes virus reactivation, have been reported. Olumiant also has a Boxed Warning regarding thrombosis, including deep vein thrombosis and pulmonary embolism which occurred at a higher rate in patients taking Olumiant vs. placebo.

POLICY STATEMENT

Prior authorization is recommended for prescription benefit coverage of Olumiant. Because of the specialized skills required for evaluation and diagnosis of patients treated with Olumiant as well as the monitoring required for adverse events and long-term efficacy, initial approval requires Olumiant to be prescribed by or in consultation with a physician who specializes in the condition being treated. All approvals are provided for the duration noted below.

All reviews for use of Oluminat for COVID-19 and/or cytokine release syndrome associated with COVID-19 will be forwarded to the Medical Director.

Automation: None.

RECOMMENDED AUTHORIZATION CRITERIA

Coverage of Olumiant is recommended in those who meet the following criteria:

FDA-Approved Indications

1. Rheumatoid Arthritis (RA). Approve for the duration noted if the patient meets ONE of the following criteria (A or B):

A) Initial Therapy. Approve for three months if the patient meets BOTH of the following (i and ii):

i. The patient has had a 3-month trial of at least ONE tumor necrosis factor inhibitor (TNFi) for this condition, unless intolerant.

NOTE: examples of TNFis include an adalimumab product (e.g., Humira), Cimzia (certolizumab SC injection), an etanercept product (e.g., Enbrel, Erelzi), an infliximab product (e.g., Remicade, Inflectra, Renflexis), Simponi SC (golimumab SC injection), or Simponi Aria (golimumab IV infusion). Conventional synthetic DMARDs such as methotrexate (MTX), leflunomide, hydroxychloroquine, and sulfasalazine do not count; AND

ii. Olumiant is prescribed by or in consultation with a rheumatologist.

B) Patients Currently Receiving Olumiant. Approve for 3 years if the patient has had a response as determined by the prescriber. Note: Examples of a response to therapy include: less joint pain, morning stiffness, or fatigue; improved function or activities of daily living; decreased soft tissue swelling in joints or tendon sheaths; improved laboratory values; reduced dosage of corticosteroids. The patient may not have a full response, but there should have been a recent or past response to Olumiant.

CONDITIONS NOT RECOMMENDED FOR APPROVAL

Olumiant has not been shown to be effective, or there are limited or preliminary data or potential safety concerns that are not supportive of general approval for the following conditions. Rationale for non-coverage for these specific conditions is provided below. (Note: This is not an exhaustive list of Conditions Not Recommended for Approval.)

1. Concurrent Use with a Biologic or with a Targeted Synthetic DMARD. Olumiant should not be administered in combination with another biologic or with a targeted synthetic DMARD used for an inflammatory condition (see [APPENDIX](#) for examples).¹ Combination therapy is generally

not recommended due to a potential for a higher rate of adverse effects with combinations and lack of evidence for additive efficacy.

2. **Concurrent use with Other Potent Immunosuppressants** (e.g., azathioprine, cyclosporine).¹ Coadministration with other potent immunosuppressive drugs has the risk of added immunosuppression and has not been evaluated in RA. Note: This does NOT exclude use of Olumiant with MTX; Olumiant has been evaluated with background MTX or combinations of conventional synthetic DMARDs containing MTX.
3. **COVID-19 (Coronavirus Disease 2019)**. Forward all requests to the Medical Director. Note: This includes requests for cytokine release syndrome associated with COVID-19.
4. Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.

APPENDIX

Biologic or Targeted Synthetic DMARD	Mechanism of Action
Cimzia [®] (certolizumab pegol for SC injection)	Inhibition of TNF
Enbrel [®] (etanercept for SC injection)	Inhibition of TNF
Erelzi [™] (etanercept-szszs for SC injection)	Inhibition of TNF
Humira [®] (adalimumab for SC injection)	Inhibition of TNF
Amjevita [™] (adalimumab-atto for SC injection)	Inhibition of TNF
Cyltezo [®] (adalimumab-adbm for SC injection)	Inhibition of TNF
Simponi [®] (golimumab for SC injection)	Inhibition of TNF
Simponi Aria [™] (golimumab for IV infusion)	Inhibition of TNF
Remicade [®] (infliximab for IV infusion)	Inhibition of TNF
Inflectra [™] (infliximab-dyyb for IV infusion)	Inhibition of TNF
Renflexis [®] (infliximab-abda for IV infusion)	Inhibition of TNF
Actemra [®] (tocilizumab for IV infusion)	Inhibition of IL-6
Actemra [®] (tocilizumab for SC injection)	Inhibition of IL-6
Kevzara [®] (sarilumab for SC injection)	Inhibition of IL-6
Orencia [®] (abatacept for IV infusion)	T-cell costimulation modulator
Orencia [®] (abatacept for SC injection)	T-cell costimulation modulator
Rituxan [®] (rituximab for IV infusion)	CD20-directed cytolytic antibody
Truxima [®] (rituximab-abbs IV injection)	CD20-directed cytolytic antibody
Kineret [®] (anakinra for subcutaneous SC injection)	Inhibition of IL-1
Stelara [®] (ustekinumab for SC injection)	Inhibition of IL-12/23
Stelara [®] (ustekinumab for IV infusion)	Inhibition of IL-12/23
Siliq [™] (brodalumab SC injection)	Inhibition of IL-17
Cosentyx [™] (secukinumab for SC injection)	Inhibition of IL-17A
Taltz [®] (ixekizumab for SC injection)	Inhibition of IL-17A
Ilumya [™] (tildrakizumab-asmn for SC injection)	Inhibition of IL-23
Skyrizi [™] (risankizumab SC injection)	Inhibition of IL-23
Tremfya [®] (guselkumab for SC injection)	Inhibition of IL-23
Otezla [®] (apremilast tablets)	Inhibition of PDE4
Olumiant [®] (baricitinib tablets)	Inhibition of the JAK pathways
Xeljanz [®] , Xeljanz XR (tofacitinib tablets, tofacitinib extended-release tablets)	Inhibition of the JAK pathways

SC – Subcutaneous; TNF – Tumor necrosis factor; IL – Interleukin; IV – Intravenous; PDE4 – Phosphodiesterase 4; JAK – Janus kinase.
